Chapter 8: Applicative functors and profunctors

Part 2: Their laws and structure

Deriving the `ap` operation from `map2`

Can we avoid having to define map_n separately for each n?

- Use curried arguments, $\text{fmap}_2 : (A \Rightarrow B \Rightarrow Z) \Rightarrow F^A \Rightarrow F^B \Rightarrow F^Z$
- Set $A \equiv (B \Rightarrow Z)$ and apply fmap_2 to the identity $\text{id}^{(B \Rightarrow Z) \Rightarrow (B \Rightarrow Z)}$: obtain $\text{ap}^{[B,Z]} : F^{B \Rightarrow Z} \Rightarrow F^B \Rightarrow F^Z \equiv \text{fmap}_2\,(\text{id})$
- The functions `fmap₂` and `ap` are computationally equivalent:

$$\text{fmap}_2\, f^{A \Rightarrow B \Rightarrow Z} = \text{fmap}\, f \circ \text{ap}$$

$$\begin{tikzcd}
& F^{B \Rightarrow Z} \arrow[dr, "\text{ap}"] & \\
F^A \arrow[ur, "\text{fmap}\, f"] \arrow[rr, "\text{fmap}_2\, (f^{A \Rightarrow B \Rightarrow Z})"'] & & (F^B \Rightarrow F^Z)
\end{tikzcd}$$

- The functions `fmap₃`, `fmap₄` etc. can be defined similarly:

$$\text{fmap}_3\, f^{A \Rightarrow B \Rightarrow C \Rightarrow Z} = \text{fmap}\, f \circ \text{ap} \circ \text{fmap}_{F^B \Rightarrow ?}\text{ap}$$

$$\begin{tikzcd}
& F^{B \Rightarrow C \Rightarrow Z} \arrow[r, "\text{ap}^{[B, C \Rightarrow Z]}"] & (F^B \Rightarrow F^{C \Rightarrow Z}) \arrow[dr, "\text{fmap}_{F^B \Rightarrow ?}\text{ap}^{[C,Z]}"] & \\
F^A \arrow[ur, "\text{fmap}\, f"] \arrow[rrr, "\text{fmap}_3\, (f^{A \Rightarrow B \Rightarrow C \Rightarrow Z})"'] & & & (F^B \Rightarrow F^C \Rightarrow F^Z)
\end{tikzcd}$$

- Using the infix syntax will get rid of $\text{fmap}_{F^B \Rightarrow ?}\text{ap}$ (see example code)
  - Note the pattern: a natural transformation is equivalent to a lifting

Deriving the `zip` operation from `map2`

- Note: Function types $A \Rightarrow B \Rightarrow C$ and $A \times B \Rightarrow C$ are equivalent
- Uncurry fmap_2 to $\text{fmap2} : (A \times B \Rightarrow C) \Rightarrow F^A \times F^B \Rightarrow F^C$
- Compute $\text{fmap2}\,(f)$ with $f = \text{id}^{A \times B \Rightarrow A \times B}$, expecting to obtain a simpler natural transformation:

$$\text{zip} : F^A \times F^B \Rightarrow F^{A \times B}$$

- This is quite similar to `zip` for lists:
  `List(1, 2).zip(List(10, 20)) = List((1, 10), (2, 20))`
- The functions `zip` and `fmap2` are computationally equivalent:

$$\text{zip} = \text{fmap2}\,(\text{id})$$

$$\text{fmap2}\,(f^{A \times B \Rightarrow C}) = \text{zip} \circ \text{fmap}\, f$$

$$\begin{tikzcd}
 & F^{A \times B} \arrow[dr, "\text{fmap}\, f^{A \times B \Rightarrow C}"] & \\
F^A \times F^B \arrow[ur, "\text{zip}"] \arrow[rr, "\text{fmap2}\,(f^{A \times B \Rightarrow C})"'] & & F^C
\end{tikzcd}$$

- The functor F is **zippable** if such a `zip` exists (with appropriate laws)
  - The same pattern: a natural transformation is equivalent to a lifting

* Equivalence of the operations `ap` and `zip`

- Set $A \equiv B \Rightarrow C$, get $\text{zip}^{[B\Rightarrow C,B]} : F^{B\Rightarrow C} \times F^B \Rightarrow F^{(B\Rightarrow C)\times B}$
- Use `eval` : $(B \Rightarrow C) \times B \Rightarrow C$ and $\text{fmap}\,(\text{eval}) : F^{(B\Rightarrow C)\times B} \Rightarrow F^C$
- Uncurry: `app`$^{[B,C]} : F^{B\Rightarrow C} \times F^B \Rightarrow F^C \equiv \text{zip} \circ \text{fmap}\,(\text{eval})$
- The functions `zip` and `app` are computationally equivalent:
  - use $\text{pair} : (A \Rightarrow B \Rightarrow A \times B) = a^A \Rightarrow b^B \Rightarrow a \times b$
  - use $\text{fmap}\,(\text{pair}) \equiv \text{pair}^{\uparrow}$ on an fa^{F^A}, get $(\text{pair}^{\uparrow} fa) : F^{B\Rightarrow A\times B}$; then

$$\text{zip}\,(fa \times fb) = \text{app}\left((\text{pair}^{\uparrow} fa) \times fb\right)$$
$$\text{app}^{[B\Rightarrow C,B]} = \text{zip}^{[B\Rightarrow C,B]} \circ \text{fmap}\,(\text{eval})$$

$$\begin{tikzcd} & F^{(B\Rightarrow C)\times B} \arrow[dr, "\text{fmap(eval)}"] & \\ F^{B\Rightarrow C} \times F^B \arrow[ur, "\text{zip}"] \arrow[rr, "\text{app}^{[B\Rightarrow C,B]}"'] & & F^C \end{tikzcd}$$

- Rewrite this using curried arguments: $\text{fzip}^{[A,B]} : F^A \Rightarrow F^B \Rightarrow F^{A\times B}$; $\text{ap}^{[B,C]} : F^{B\Rightarrow C} \Rightarrow F^B \Rightarrow F^C$; then $\text{ap}\, f = \text{fzip}\, f \circ \text{fmap}\,(\text{eval})$.
- Now $\text{fzip}\, p^{F^A} q^{F^B} = \text{ap}\,\left(\text{pair}^{\uparrow} p\right) q$, hence we may omit the argument q: $\text{fzip} = \text{pair}^{\uparrow} \circ \text{ap}$. With explicit types: $\text{fzip}^{[A,B]} = \text{pair}^{\uparrow} \circ \text{ap}^{[B,A\Rightarrow B]}$.

Motivation for applicative laws. Naturality laws for `map2`

Treat `map2` as a replacement for a monadic block with independent effects:

```
for {
  x ← cont1
  y ← cont2
} yield g(x, y)
```

```
map2 (
  cont1,
  cont2
) { (x, y) ⇒ g(x, y) }
```

- Main idea: Formulate the monad laws in terms of `map2` and `pure`

Naturality laws: Manipulate data in one of the containers

```
for {
  x ← cont1.map(f)
  y ← cont2
} yield g(x, y)
```

```
for {
  x ← cont1
  y ← cont2
} yield g(f(x), y)
```

and similarly for `cont2` instead of `cont1`; now rewrite in terms of for `map2`:

- **Left naturality** for `map2`:

```
map2(cont1.map(f), cont2)(g)
  = map2(cont1, cont2){ (x, y) ⇒ g(f(x), y) }
```

- **Right naturality** for `map2`:

```
map2(cont1, cont2.map(f))(g)
  = map2(cont1, cont2){ (x, y) ⇒ g(x, f(y)) }
```

Associativity and identity laws for `map2`

Inline two generators out of three, in two different ways:

```
for {
  x ← cont1
  (y, z) ← for {
             yy ← cont2
             zz ← cont3
          } yield (yy, zz)
} yield g(x, y, z)
```

```
for {
  (x, y) ← for {
              xx ← cont1
              yy ← cont2
            } yield (xx, yy)
   z ← cont3
} yield g(x, y, z)
```

Write this in terms of `map2` to obtain the **associativity law** for `map2`:

```
map2(cont1, map2(cont2, cont3)((_,_)){ case(x,(y,z))⇒g(x,y,z)}
  = map2(map2(cont1, cont2)((_,_)), cont3){ case((x,y),z))⇒g(x,y,z)}
```

Empty context precedes a generator, or follows a generator:

```
for { x ← pure(a)
      y ← cont
} yield g(x, y)
```

```
for {
  y ← cont
} yield g(a, y)
```

Write this in terms of `map2` to obtain the **identity laws** for `map2` and `pure`:

```
map2(pure(a), cont)(g) = cont.map { y ⇒ g(a, y) }
map2(cont, pure(b))(g) = cont.map { x ⇒ g(x, b) }
```

Deriving the laws for `zip`: naturality law

- The laws for `map2` in a short notation; here $f \otimes g \equiv \{a \times b \Rightarrow f(a) \times g(b)\}$

$$\text{fmap2}\left(g^{A\times B\Rightarrow C}\right)\left(f^{\uparrow}q_1 \times q_2\right) = \text{fmap2}\left((f \otimes \text{id}) \circ g\right)(q_1 \times q_2)$$

$$\text{fmap2}\left(g^{A\times B\Rightarrow C}\right)\left(q_1 \times f^{\uparrow}q_2\right) = \text{fmap2}\left((\text{id} \otimes f) \circ g\right)(q_1 \times q_2)$$

$$\text{fmap2}\left(g_{1.23}\right)\left(q_1 \times \text{fmap2}\left(\text{id}\right)\left(q_2 \times q_3\right)\right) = \text{fmap2}\left(g_{12.3}\right)\left(\text{fmap2}\left(\text{id}\right)\left(q_1 \times q_2\right) \times q_3\right)$$

$$\text{fmap2}\left(g^{A\times B\Rightarrow C}\right)\left(\text{pure}\, a^{A} \times q_2^{F^B}\right) = \left(b \Rightarrow g\left(a \times b\right)\right)^{\uparrow} q_2$$

$$\text{fmap2}\left(g^{A\times B\Rightarrow C}\right)\left(q_1^{F^A} \times \text{pure}\, b^{B}\right) = \left(a \Rightarrow g\left(a \times b\right)\right)^{\uparrow} q_1$$

- Express `map2` through `zip`:

$$\text{fmap}_2\, g^{A\times B\Rightarrow C}\left(q_1^{F^A} \times q_2^{F^B}\right) \equiv \left(\text{zip} \circ g^{\uparrow}\right)(q_1 \times q_2)$$

$$\text{fmap}_2\, g^{A\times B\Rightarrow C} \equiv \text{zip} \circ g^{\uparrow}$$

- Combine the two naturality laws into one by using two functions f_1, f_2:

$$\left(f_1^{\uparrow} \otimes f_2^{\uparrow}\right) \circ \text{fmap2}\, g = \text{fmap2}\left((f_1 \otimes f_2)^{\uparrow} \circ g\right)$$

$$\left(f_1^{\uparrow} \otimes f_2^{\uparrow}\right) \circ \text{zip} \circ g^{\uparrow} = \text{zip} \circ (f_1 \otimes f_2)^{\uparrow} \circ g^{\uparrow}$$

- The **naturality law** for `zip` then becomes: $\left(f_1^{\uparrow} \otimes f_2^{\uparrow}\right) \circ \text{zip} = \text{zip} \circ (f_1 \otimes f_2)^{\uparrow}$

Deriving the laws for `zip`: associativity law

- Express `map2` through `zip` and substitute into the associativity law:

$$g^{\uparrow}_{1.23}\left(\mathrm{zip}\left(q_1 \times \mathrm{zip}\left(q_2 \times q_3\right)\right)\right) = g^{\uparrow}_{12.3}\left(\mathrm{zip}\left(\mathrm{zip}\left(q_1 \times q_2\right) \times q_3\right)\right)$$

- The arbitrary function g is preceded by transformations of the tuples,

$$a \times (b \times c) \equiv (a \times b) \times c \quad \text{(type isomorphism)}$$

- Assume that the isomorphism transformations are applied as needed, then we may formulate the **associativity law** for `zip` more concisely:

$$\mathrm{zip}\left(q_1 \times \mathrm{zip}\left(q_2 \times q_3\right)\right) \cong \mathrm{zip}\left(\mathrm{zip}\left(q_1 \times q_2\right) \times q_3\right)$$

$$\begin{tikzcd}
F^{(A\times B)\times C} \arrow[r, leftrightarrow] & F^{A\times B\times C} \arrow[r, leftrightarrow] & F^{A\times(B\times C)} \\
F^{A\times B} \times F^{C} \arrow[u, "\mathrm{zip}"] & F^{A} \arrow[r] \arrow[ddl] & F^{A} \times F^{B\times C} \arrow[u, "\mathrm{zip}"'] \\
F^{A\times B} \arrow[u] & F^{C} \arrow[ul] \arrow[dr] & F^{B\times C} \arrow[u] \\
F^{A} \times F^{B} \arrow[u, "\mathrm{zip}"] & F^{B} \arrow[l] \arrow[r] & F^{B} \times F^{C} \arrow[u, "\mathrm{zip}"']
\end{tikzcd}$$

Deriving the laws for `zip`: identity laws

- Identity laws seem to be complicated, e.g. the left identity:

$$g^{\uparrow}\left(\text{zip}\left(\text{pure}\,a\times q\right)\right)=\left(b\Rightarrow g\left(a\times b\right)\right)^{\uparrow}q$$

- Replace `pure` by an *equivalent* "wrapped unit" method `wu: F[Unit]`

$$\text{wu}^{F^{\mathbf{1}}}\equiv\text{pure}\left(1\right);\quad\text{pure}(a^{A})=\left(1\Rightarrow a\right)^{\uparrow}\text{wu}$$

Then the left identity law can be simplified using left naturality:

$$g^{\uparrow}\left(\text{zip}\left(\left(\left(1\Rightarrow a\right)^{\uparrow}\text{wu}\right)\times q\right)\right)=g^{\uparrow}\left(\left(\left(1\Rightarrow a\right)\otimes\text{id}\right)^{\uparrow}\text{zip}\left(\text{wu}\times q\right)\right)$$

- Denote $\phi^{B\Rightarrow 1\times B}\equiv b\Rightarrow 1\times b$ and $\beta_a^{1\times B\Rightarrow A\times B}\equiv\left(1\Rightarrow a\right)\otimes\text{id}$; then the function $b\Rightarrow g\left(a\times b\right)$ can be expressed more simply as $\phi\circ\beta_a\circ g$, and the naturality law becomes

$$g^{\uparrow}(\beta_a^{\uparrow}\,\text{zip}\left(\text{wu}\times q\right))=\left(\beta_a\circ g\right)^{\uparrow}\left(\text{zip}\left(\text{wu}\times q\right)\right)=\left(\phi\circ\beta_a\circ g\right)^{\uparrow}q=\left(\beta_a\circ g\right)^{\uparrow}\left(\phi^{\uparrow}q\right)$$

Omitting the common prefix $\left(\beta_a\circ g\right)^{\uparrow}$, we obtain the **left identity** law:

$$\text{zip}\left(\text{wu}\times q\right)=\phi^{\uparrow}q$$

  - Note that $\phi^{\uparrow}$ is an isomorphism between F^{B} and $F^{1\times B}$
    - Assume that this isomorphism is applied as needed, then we may write

$$\text{zip}\left(\text{wu}\times q\right)\cong q$$

  - Similarly, the **right identity** law can be written as $\text{zip}\left(q\times\text{wu}\right)\cong q$

Similarity between applicative laws and monoid laws

- Define infix syntax for `zip` and write $\text{zip}\,(p \times q) \equiv p \bowtie q$
- Then the associativity and identity laws may be written as

$$q_1 \bowtie (q_2 \bowtie q_3) \cong (q_1 \bowtie q_2) \bowtie q_3$$

$$(\text{wu} \bowtie q) \cong q$$

$$(q \bowtie \text{wu}) \cong q$$

  These are the laws of a monoid (with some assumed transformations)
- Naturality law for `zip` written in the infix syntax:

$$f_1^{\uparrow} q_1 \bowtie f_2^{\uparrow} q_2 = (f_1 \otimes f_2)^{\uparrow} (q_1 \bowtie q_2)$$

- `wu` has no laws; the naturality for `pure` follows automatically
- The laws are simplest when formulated in terms of `zip` and `wu`
  - Naturality for `zip` will usually follow from parametricity
    - A third naturality law for `map2` follows from defining `map2` through `zip`!
- "Zippable" functors have only the associativity and naturality laws
- Applicative functors are a strict subset of monadic functors
  - There are applicative functors that *cannot* be monads
  - Applicative functor implementation may disagree with the monad

A third naturality law for `map2`

- There must be one more naturality law for `map2`
- Transform the result of a `map2`:

```
( for {
  x ← cont1
  y ← cont2
} yield g(x, y)  ).map(f)
```

```
for {
  x ← cont1
  y ← cont2
} yield f( g(x, y) )
```

- Write this in terms of `map2`, obtain a third naturality law:

```
map2(cont1, cont2)(g).map(f)
  = map2(cont1, cont2)(g andThen f)
```

$$\mathtt{fmap2}\,(g)\circ f^{\uparrow}=\mathtt{fmap2}\,(g\circ f)$$

$$f^{\uparrow}\,(\mathtt{fmap2}\,(g)\,(p\times q))=\mathtt{fmap2}\,(g\circ f)\,(p\times q)$$

- This law automatically follows if we define `map2` through `zip`:

$$\text{fmap2}\,(g)\circ f^{\uparrow}=\text{zip}\circ g^{\uparrow}\circ f^{\uparrow}=\text{zip}\circ(g\circ f)^{\uparrow}$$

- Note: we always have one naturality law per type parameter

Applicative operation ap as a "lifting"

- Consider ap as a "lifting", of type $F^{A\Rightarrow B} \Rightarrow (F^A \Rightarrow F^B)$
- A "lifting" should obey the identity and the composition laws
  - An "identity" value of type $F^{A\Rightarrow A}$, mapped to $\text{id}^{F^A\Rightarrow F^A}$ by ap
    - A good candidate for that value is $\text{id}_\odot \equiv \text{pure}\,(\text{id}^{A\Rightarrow A})$
  - A "composition" of an $F^{A\Rightarrow B}$ and an $F^{B\Rightarrow C}$, yielding an $F^{A\Rightarrow C}$
    - We can use map2 to implement this composition, denoted $g \odot h$:

$$g^{F^{A\Rightarrow B}} \odot h^{F^{B\Rightarrow C}} \equiv \text{fmap2}\,(p^{A\Rightarrow B} \times q^{B\Rightarrow C} \Rightarrow p \circ q)\,(g, h)$$

- What are the laws that follow for $g \odot h$ from the map2 laws?

$$\text{id}_\odot \odot h = h; \quad g \odot \text{id}_\odot = g$$

$$g^{F^{A\Rightarrow B}} \odot (h^{F^{B\Rightarrow C}} \odot k^{F^{C\Rightarrow D}}) = (g \odot h) \odot k$$

$$\left((x^{B\Rightarrow C} \Rightarrow f^{A\Rightarrow B} \circ x)^{\uparrow} g^{F^{B\Rightarrow C}}\right) \odot h^{F^{C\Rightarrow D}} = (x^{B\Rightarrow D} \Rightarrow f^{A\Rightarrow B} \circ x)^{\uparrow}\,(g \odot h)$$

$$g^{F^{A\Rightarrow B}} \odot \left((x^{B\Rightarrow C} \Rightarrow x \circ f^{C\Rightarrow D})^{\uparrow} h^{F^{B\Rightarrow C}}\right) = (x^{A\Rightarrow C} \Rightarrow x \circ f^{C\Rightarrow D})^{\uparrow}\,(g \odot h)$$

  - The first 3 laws are the identity & associativity laws of a *category*
    - The morphism type is $A \rightsquigarrow B \equiv F^{A\Rightarrow B}$, the composition is $\odot$
  - The last 2 laws are naturality laws, connecting fmap and $\odot$
- Therefore ap is a functor's "lifting" of morphisms from two categories

Deriving the category laws for $(\mathrm{id}_\odot, \odot)$

The five laws for $\mathrm{id}_\odot$ and $\odot$ follow from the five `map2` laws

- Consider $\mathrm{id}_\odot \odot h$ and substitute the definition of $\odot$ via `map2`, cf. slide 7: $\mathrm{id}_\odot \odot h = \mathrm{fmap2}\,(p \times q \Rightarrow p \circ q)\,(\mathrm{pure}\,(\mathrm{id}) \times h) = (b \Rightarrow \mathrm{id} \circ b)^\uparrow\, h = h$
- The law $g \odot \mathrm{id}_\odot = g$ is derived similarly
- Associativity law: $g \odot (h \odot k) = \mathrm{fmap2}\,(\circ)\,(g \times \mathrm{fmap2}\,(\circ)\,(h \times k))$ The 3rd naturality law gives: $\mathrm{fmap2}\,(\circ)\,(h \times k) = (\circ)^\uparrow\,(\mathrm{fmap2}\,(\mathrm{id})\,(h \times k))$, and then:

$$g \odot (h \odot k) = \mathrm{fmap2}\,(x \times (y \times z) \Rightarrow x \circ y \circ z)\,(g \times \mathrm{fmap2}\,(\mathrm{id})\,(h \times k))$$
$$(g \odot h) \odot k = \mathrm{fmap2}\,((x \times y) \times z \Rightarrow x \circ y \circ z)\,(\mathrm{fmap2}\,(\mathrm{id})\,(g \times h) \times k)$$

  Now the associativity law for fmap2 yields $g \odot (h \odot k) = (g \odot h) \odot k$
- Derive naturality laws for $\odot$ from the three map_2 naturality laws: $((x \Rightarrow f \circ x)^\uparrow g) \odot h = \mathrm{fmap2}\,(\circ)\,((x \Rightarrow f \circ x)^\uparrow g \times h) =$ $\mathrm{fmap2}\,(x \times y \Rightarrow f \circ x \circ y)\,(g \times h) = (x \Rightarrow f \circ x)^\uparrow\,(\mathrm{fmap2}\,(\circ)\,(g \times h)) =$ $(x \Rightarrow f \circ x)^\uparrow\,(g \odot h)$
- The law is $g \odot (x \Rightarrow x \circ f)^\uparrow h = (x \Rightarrow x \circ f)^\uparrow\,(g \odot h)$ is derived similarly

Deriving the functor laws for `ap`

Now that we established the laws for $\odot$, we have `ap` laws:

$$\text{ap}^{[B,Z]} : F^{B\Rightarrow Z} \Rightarrow F^B \Rightarrow F^Z = \text{fmap}_2\left(\text{id}^{(B\Rightarrow Z)\Rightarrow(B\Rightarrow Z)}\right)$$

Identity law: $\text{ap}\,(\text{id}_\odot) = \text{id}^{F^A\Rightarrow F^A}$

- Derivation: $\text{ap}\,(\text{id}_\odot^{F^{A\Rightarrow A}})\,(q^{F^A}) = \text{fmap}_2(\text{id}^{(A\Rightarrow A)\Rightarrow A\Rightarrow A})\,(\text{pure}\,(\text{id}^{A\Rightarrow A}))\,(q^{F^A}) =$ $\text{fmap2}\,(f \times x \Rightarrow f(x))\,(\text{pure}\,(\text{id}) \times q) = (x \Rightarrow \text{id}(x))^{\uparrow} q = \text{id}^{\uparrow} q = q$
- Easier derivation: first, express ap via $\odot$ using the isomorphisms

$$A \cong 1 \to A; \quad F^A \cong F^{1\to A}$$

Then $\text{ap}\,(p^{F^{B\Rightarrow Z}})\,(q^{F^B}) \cong q^{F^{\mathbf{1}\to B}} \odot p^{F^{B\to Z}}$ and so $\text{ap}\,(\text{id}_\odot)\,(q) \cong q \odot \text{id}_\odot = q$

Composition law: $\text{ap}\,(g \odot h) = \text{ap}\,(g) \circ \text{ap}\,(h)$

- Derivation: $\text{ap}\,(g \odot h)\,(q) \cong q \odot (g \odot h)$ while $(\text{ap}\,(g) \circ \text{ap}\,(h))\, q =$ $\text{ap}\,(h)\,(\text{ap}\,(g)\,(q)) \cong \text{ap}\,(h)\,(q \odot g) \cong (q \odot g) \odot h$

Constructions of applicative functors

- All monadic constructions still hold for applicative functors
- Additionally, there are some non-monadic constructions

1. $F^A \equiv 1$ (constant functor) and $F^A \equiv A$ (identity functor)
2. $F^A \equiv G^A \times H^A$ for any applicative G^A and H^A
   - but $G^A + H^A$ is in general *not* applicative
3. $F^A \equiv A + G^A$ for any applicative G^A (**free pointed** over G)
4. $F^A \equiv A + G^{F^A}$ (recursive) for any functor G^A (**free monad** over G)
5. $F^A \equiv H^A \Rightarrow A$ for any contrafunctor H^A

   Constructions that are not monadic:
6. $F^A \equiv Z$ (constant functor, Z a monoid)
7. $F^A \equiv Z + G^A$ for any applicative G^A and monoid Z
8. $F^A \equiv G^{H^A}$ when both G and H are applicative
9. $F^A \equiv G^A + H^{G^A}$ where H is any functor and G is applicative

All non-parameterized exp-poly types are monoids

- Using known monoid constructions (Chapter 7), we can implement $X + Y$, $X \times Y$, $X \Rightarrow Y$ as monoids when X and Y are monoids
- All primitive types have at least one monoid instance:
  - `Int`, `Float`, `Double`, `Char`, `Boolean` are "numeric" monoids
  - `Seq[A]`, `Set[A]`, `Map[K,V]` are set-like monoids
  - `String` is equivalent to a sequence of integers; `Unit` is a trivial monoid
- Therefore, all exponential-polynomial types without type parameters are monoids in at least one way
- Example of an exponential-polynomial type without type parameters: $\text{Int} + \text{String} \times \text{String} \times (\text{Int} \Rightarrow \text{Bool}) + (\text{Bool} \times \text{String} \Rightarrow 1 + \text{String})$
- Example of a non-monoid type with type parameters: $A \Rightarrow B$

By constructions 1, 3, and 7, *all* polynomial F^A with monoidal coefficients are applicative: write $F^A = Z_1 + A \times (Z_2 + A \times ...)$ with some monoids Z_i

- $F^A = 1 + A \times A$ (this F^A is not a monad!)
- $F^A = A + A \times A \times Z$ where Z is a monoid (this F^A is a monad)

Examples of non-polynomial functors that are not applicative:

- $F^A \equiv (A \Rightarrow R) \Rightarrow S$; $\quad F^A \equiv (R \Rightarrow A) + (S \Rightarrow A)$

Definition and constructions of applicative contrafunctors

- The applicative functor laws, if formulated via `zip` and `wu`, do not use `map` and therefore can be used for contrafunctors
- Define an **applicative contrafunctor** C^A as having `zip` and `wu`:

$$\text{zip} : C^A \times C^B \Rightarrow C^{A \times B}; \quad \text{wu} : C^1$$

- Identity and associativity laws must hold for `zip` and `wu`
  - Note: applying `contramap` to the function $a \times b \Rightarrow a$ will yield some $C^A \Rightarrow C^{A \times B}$, but this will *not* give a valid implementation of `zip`!
- Naturality must hold for `zip`, but with `contramap` instead of `map`
  - The corresponding `contraap` has type signature $F^{B \Rightarrow A} \Rightarrow (F^A \Rightarrow F^B)$

Applicative contrafunctor constructions:

1. $C^A \equiv Z$ (constant functor, Z a monoid)
2. $C^A \equiv G^A \times H^A$ for any applicative contrafunctors G^A and H^A
3. $C^A \equiv G^A + H^A$ for any applicative contrafunctors G^A and H^A
4. $C^A \equiv H^A \Rightarrow G^A$ for any functor H^A and applicative contrafunctor G^A
5. $C^A \equiv H^{G^A}$ for any functor H^A and applicative contrafunctor G^A

- *All* exponential-polynomial contrafunctors with monoidal coefficients are applicative! (These constructions cover all exp-poly cases.)

Definition and constructions of applicative profunctors

- **Profunctors** have the type parameter in both contravariant and covariant positions; they can have neither `map` nor `contramap`
  - They have `dimap` of type $(A \Rightarrow B) \times (B \Rightarrow A) \Rightarrow (F^A \Rightarrow F^B)$
- Examples of profunctors: $P^A \equiv \text{Int} \times A \Rightarrow A; \quad P^A \equiv A + (A \Rightarrow R)$
- *All* exp-poly type constructors are profunctors since the type parameter is always in either a covariant or a contravariant position
- Definition of **applicative profunctor**: has `zip` and `wu` with the laws
  - The corresponding `diap` is of type $F^{(A \Rightarrow B) \times (B \Rightarrow A)} \Rightarrow (F^A \Rightarrow F^B)$

Applicative profunctors have all previous constructions, and additionally:

1. $P^A \equiv G^A \times H^A$ for any applicative profunctors G^A and H^A
2. $P^A \equiv Z + G^A$ for any applicative profunctor G^A and monoid Z
3. $P^A \equiv A + G^A$ for any applicative profunctor G^A
4. $P^A \equiv G^A + H^{G^A}$ for any functor H^A and applicative profunctor G^A
5. $P^A \equiv H^A \Rightarrow A$ for any profunctor H^A
6. $P^A \equiv H^{G^A}$ and G^{H^A} for any functor H^A and applicative profunctor G^A

Examples of non-applicative profunctors:

- $P^A \equiv (A \Rightarrow A) + (R \Rightarrow A); \quad P^A \equiv (A \Rightarrow A) \Rightarrow 1 + A$

Categorical overview of standard functor classes

The "liftings" characterize the types of category's morphisms

name	category morphism	lifting name and type signature
functor	$A \Rightarrow B$	$\text{fmap} : (A \Rightarrow B) \Rightarrow F^A \Rightarrow F^B$
filterable	$A \Rightarrow 1 + B$	$\text{fmapOpt} : (A \Rightarrow 1 + B) \Rightarrow F^A \Rightarrow F^B$
monad	$A \Rightarrow F^B$	$\text{flm} : \left(A \Rightarrow F^B\right) \Rightarrow F^A \Rightarrow F^B$
applicative	$F^{A \Rightarrow B}$	$\text{ap} : F^{A \Rightarrow B} \Rightarrow F^A \Rightarrow F^B$
contrafunctor	$B \Rightarrow A$	$\text{contrafmap} : (B \Rightarrow A) \Rightarrow F^A \Rightarrow F^B$
profunctor	$(A \Rightarrow B) \times (B \Rightarrow A)$	$\text{dimap} : (A \Rightarrow B) \times (B \Rightarrow A) \Rightarrow F^A \Rightarrow F^B$
contra-filterable	$B \Rightarrow 1 + A$	$\text{contrafmapOpt} : (B \Rightarrow 1 + A) \Rightarrow F^A \Rightarrow F^B$
contra-applicative	$F^{B \Rightarrow A}$	$\text{contraap} : F^{B \Rightarrow A} \Rightarrow F^A \Rightarrow F^B$
pro-applicative	$F^{(A \Rightarrow B) \times (B \Rightarrow A)}$	$\text{proap} : F^{(A \Rightarrow B) \times (B \Rightarrow A)} \Rightarrow F^A \Rightarrow F^B$
Not yet considered:		
comonad	$F^A \Rightarrow B$	$\text{coflm} : \left(F^A \Rightarrow B\right) \Rightarrow F^A \Rightarrow F^B$

The laws are always just the category laws and the naturality laws

The category's identity morphism needs to be defined specially in each case

- Some of these possibilities (e.g. "contramonad") do not actually work

Exercises

1. Show that `pure` will be automatically a natural transformation when it is defined using `wu` as shown.
2. Show that $F^A \equiv (A \Rightarrow Z) \Rightarrow (1 + A)$ is a functor but not applicative.
3. Show that P^S is a monoid if S is a monoid and P is any applicative functor, contrafunctor, or profunctor.
4. Use naturality of `pure` to show that $\text{pure}\, f \odot \text{pure}\, g = \text{pure}\,(f \odot g)$
